Abstract : The authors observed 9 patients; 5 of them took promedole (I) intermittently (few months), when morphine and opium were unobtainable; 4 patients used almost exclusively I in the course of 3 months to 2 years. Four patients used I intravenously up to 200 ml of 1 percent solution, which is 25 times larger than the daily subcutaneous dose; the remaining patients used (to 40 ml of 2 percent solution) subcutaneously or (to 0.25 g) internally. The patients consider one of I's drawbacks its shorter duration of effect as compared with morphine and pantepon. No difference in the type of reaction and its duration.

AUTHOR: Gol'denberg, M. A.

TITLE: Occurrence of maniac syndrome during tofranil treatment

PERIODICAL: Zhurnal nevropatologii i psikiatrii imeni S. S. Korsakova, v. 62, no. 2, 1962, 210-213

TEXT: A maniac syndrome, mainly of the hypomaniac type, may occur during tofranil treatment, not because of endogenous factors, but in direct relation with the drug. The author reports observations on 11 patients and discusses the history of 33 more patients treated with tofranil. The tofranil-induced maniac syndrome is a well-established fact, since it occurred in schizophrenic patients with hallucinatory-paranoid syndromes as well as in paranoid-katatonic-depressive patients, i.e. in cases in which manias usually were absent. A "maniac state" in dogs was provoked by adding, for several days, relatively large doses of tofranil to their food. The maniac syndrome induced by tofranil may serve as a model for the study of pathogenesis of manias in man. The prognosis was better in cases in which remission was preceded by a maniac state, but this statement requires further study.

Title : Regarding Therapeutic Properties of Citral in Some Dermatoses.

Orig Pub : Vrachebn. dyelo, 1957, No 3, 295-296

Abstract : Thirty nine patients suffering from various forms of eczema were treated with an ointment, containing 0.25-1% of citral. The more acute the process, the less citral was contained in the ointment. The ointment was prepared on a base consisting of 40 parts of paraffin, 10 parts of lanolin and 50 parts of vaseline. A therapeutic effect was observed in 29 patients.

Psychosocial evolution plays a significant role in the etiology and pathogenesis of hypertensive disease. It is necessary to ensure widespread antihypertensive measure and specifically to measure the blood pressure of all individuals over 30 years of age. Establishing an early diagnosis and providing regular and timely medical treatment of patients are of prime importance.

TITLE: Conditions of Processing and Properties of  
"Altena" Polyethylene<sup>6</sup>

PERIODICAL: Revista de Chimie, 1959, Vol 10, Nr 10, pp 596-601

ABSTRACT: "Altena" is the name of a product at a pilot station of the ICECHIM Plant where a polymer of ethylene is obtained at a low pressure, "aluminum alkyl" being used as a catalyst. The characteristics of the polymer obtained normally differ according to the conditions in which synthesis took place. This article shows a few aspects and characteristics of "Altena" which is processed by injection, extrusion and pressing and has been tested by the Plastic Materials Section of the Institutul de Cercetări Chimice (Chemical Research Institute) - ICECHIM - in Bucharest. The main

Card 1/3

RUM/3-59-10-12/16

Conditions of Processing and Properties of "Altena" Poly-  
ethylene

objects were: a) Identification of polymers from synthesis by their principal characteristics; b) establishing various possibilities for the use of these polymers; and c) finding the optimum conditions for processing these polymers by injection, extrusion and pressing. "Altena" plates are used for manufacturing chemical equipment. They can be made from a single type of polymer or from a mixture of types; the latter cannot be used since their molecular weight is either too small or too great. Materials now considered unsuitable can possibly be used for extrusion and injection. Industrial equipment has been successfully tested at the Bucharest Plastic Materials Laboratory and at the ICECHIM plant. "Altena" products are similar to foreign products like the "Hostalen" foreign polymer shown in table 2. The domestic polymer "Altena" can be used successfully in Rumania

Card 2/3

RUM/3-59-10-12/16

Conditions of Processing and Properties of "Altena" Poly-  
ethylene

to replace similar imported products. The darker color which is presently characteristic of "Altena" does not make a great difference since quality alone plays the important role. ✓  
There are 19 graphs, 3 diagrams and 2 tables.

AUTHOR: Goldenberg, M., Engineer

TITLE: Aspects of the Plastics Industry Within the Six-Year Plan and Its Importance for the National Economy

PERIODICAL: Revista de Chimie, 1960, Vol. 11, No. 10, pp. 557-562

TEXT After briefly mentioning the development of the Rumanian plastics industry and listing the plants which at present produce plastic materials, the author presents a few details on future plans regarding the production of plastics. In 1959, Rumania produced 6,600 t of plastic materials and synthetic resins, but an output of 95,000 t is planned for 1965. This includes 42,000 t of PVC, polyolefines especially polyethylene, 5,000 t of polystyrenes and copolymers relon, polyurethane, 2,000 t of resins on the basis of melamines, urea and formaldehyde, 1,000 t of nonsaturated polyesters, epoxy resins, phenoplasts, etc. In order to achieve this production volume, new chemical plants for the production and processing of plastics will be built. The Combinatul chimic (Chemical Combine) in Borzești - Onesti was constructed with the help of the USSR. The combine will produce 36,000 t of PVC, copolymers, and intermediary, respectively auxiliary products for the plastics industry. The majority of the 42,000 t of PVC to be pro-

TITLE: Method of Coating Metal Surfaces by Sintering Polyethane Powder in Fluidized Bed

PERIODICAL: Revista de Chimie, 1960, Vol. 11, No. 11, pp. 653 - 657

TEXT: Subject article deals with the protection of metal surfaces against corrosion by coating them with a thin plastic layer. Polyethane proved to be highly resistant against various corroding agents. The best way of application is the sintering of polyethane powder in fluidized bed. This method consists in immersing the preheated metal part in the fluidized polyethane powder, removing the excess powder, and finally applying thermal treatment to obtain a uniform distribution of the polyethane coating. Experiments have been conducted in order to produce a protective coating of a low-pressure Rumanian polyethane. The metal parts have been preheated to 250°C, 280°C and 300°C. Non-preheated air has been used as fluidizing agent. Preheated air of 90°C did not supply better results. The immersion time ranged between 3 - 10 sec. The temperature of the thermal treatment performed in order to obtain a uniform distribution was kept 20 - 30°C below the preheating

Method of Coating Metal Surfaces by Sintering Polyethane Powder in Fluidized Bed

temperature, the treatment itself lasted for 1 - 3 min. The fluidizing vessel consisted of a cylindrical container, 200 mm high, 100 mm in diameter, having at the bottom a glass plate with pores  $50\mu$  in diameter each. This plate serves for the dispersion of the fluidizing agent in the polyethane bed. The air inlet nozzle between the bottom and the glass plate had a diameter of 12 mm. The powder has been fluidized with compressed air and the thermal treatment has been accomplished in a common laboratory drier with automatic temperature control. The polyethane had a fluidity index of 0.6 - 0.7 g/10 min and particles ranging between 0.07 and 0.1 mm. Before being used, the polyethane powder had been dried for 24 hrs at 60°C. The parts were made of 0.5 - 3 mm soft sheet metal. They have been degreased in a 1:1 toluene-acetone mixture and pickled in a 50% sulphuric acid solution. In order to establish the best operation, several preliminary experiments have been conducted. The preheating temperature has a direct effect on the thickness of the coating. The coating is transparent and bright, it is very elastic, and has a perfect adherence. It is resistant to 50% sulphuric acid, 37% hydrochloric acid, 85% phosphoric acid, 50% sodium hydroxide, etc. Good results were obtained in the Laboratorul de Incercare si Prelucrare a Materialelor Plastic (Laboratory for Test-

TITLE: Evaluation of the possibility of reprocessing polycarbonates

SOURCE: Plasticheskiye massy, no. 6, 1963, 29-32

TOPIC TAGS: reprocessing polycarbonates, polycarbonates, index of fusion

ABSTRACT: It was determined that the index of fusion is a direct and easy guide in evaluating the possibility of processing polycarbonates. Polymers with an index between 0.8 and 3 gm/10 min. can be processed under normal conditions, i.e. extruded or molded under pressure. If the index is below 0.8, the polymer is worked with difficulty, if at all. If the index is higher than 3, the material is too brittle. However, polymers of extreme fusion indexes can be mixed to give an index in the desired range, forming products which can be processed at normal conditions and which have high mechanical property values. TITLE: The chromoplastic materials -- a new type of materials used to study the behavior of constructions by means of model tests

SOURCE: Revista de chimie, V. 14, No. 6, 1963, 341-345

TOPIC TAGS: CSDP-30 chromoplastic material, plastic deformation

ABSTRACT: The purpose of the work was to study the properties of chromoplastic materials, particularly CSDP-30 [not further identified]. The physical-mechanical properties of the substance are given in tabular form, as are the values relating to its tearing behavior and resistance to various stresses. In all these compounds, the appearance of color marks the beginning of plastic deformation. The value at which the color-chromoplastic effect appears depends on concrete test conditions, as shown in a table and several figures. The tests of CSDP-30 at 22°C showed that at application speeds below 66 mm/min, elongation is more pronounced and resistance to breaking is smaller, while the effect appears earlier; above 60 mm/min, elongation declines and resistance to breaking increases. The appearance of the chromoplastic phenomenon is also related to the test temperature.

Card 1/2

L 17203-63  
ACCESSION NR: AP3005754

O

Various hypotheses are advanced to explain the chromoplastic phenomenon. The usefulness of the phenomenon lies in its indication of the appearance of plastic articulations and plastifying zones by means of color changes. The theoretical advantages lies in the determination of the behavior of the resistance systems and of the secondary phenomena and in the obtaining of concrete indications instead of hypotheses and mathematically calculated results. Orig. art. has: 8 figures and 4 tables.

"A Study of the Process of the Reversion of Phases in Emulsions," P. A. Rebinder, G. A. Ab, N. L. Gol'denberg, Section for Dispersed Systems, Institute of Physical Chemistry, Academy of Sciences of the USSR, 6 pp

"Kolloidnyy Zhurnal" Vol IX, No 1

The study of the self-formed particulars of the process of reversion of phases in emulsions, i.e., the transformation of a emulsion of one type, e.g., a reverse emulsion of water in oil (W/O), into a direct emulsion of the type (O/W) or oil in water. Data obtained was in agreement with the principles expressed by Finkle, Draper, and Hildebrand with regard to the characteristic of soaps-potassium, sodium to emulsify oil in water.

TITLE: 25 Years of the Work of ORGRES in Power Engineering  
(25 let raboty ORGRES v teploenergetike)

PERIODICAL: Teploenergetika, 1958, Nr 5, pp 89 - 91 (USSR).

ABSTRACT: By 1933, a number of large regional power stations had been built. In order to solve the problems associated with the starting-up adjustment and improvement of new and existing power equipment, the Commissariat for Heavy Industry, in May 1933, organised the State Trust for the Organization and Efficiency of Regional Electric Power Stations and Systems (ORGRES). In the 25 years of its existence, ORGRES has done a great deal towards the development of Soviet power engineering. Its staff assist operating staff in the commissioning of equipment after erection, draw up working instructions, and train operating staff. ORGRES also helped to develop new techniques in thermal and electrical power engineering. For these purposes, they have a number of laboratories and also make use of power-station operating experience.

At present, in addition to the central organisation in Moscow, ORGRES has four divisions, each working on a single theme:

Card 1/5

DDW/PB-58-5-2a/27

## 25 Years of the Work of ORGRES in Power Engineering

the Donets' in Gorlovka, the Southern in I'evov, the Ural in Sverdlovsk and the Siberian in Novosibirsk. The main achievements of the divisions of ORGRES are then briefly recited in the following paragraphs.

**Boiler installations.** In 25 years, ORGRES has helped to start up and adjust more than 350 boilers. Working conditions for drum-type ball mills were worked out in 1934-35. Later, study was made of ball-mill operation and construction to obtain the best results. Experience was accumulated with shaft-mill furnaces and a successful burner was developed for anthracite dust.

ORGRES first applied liquid slag-removal in 1936. The physical and chemical properties of slags were studied. Forced- and induced-draught fans were modernised on the basis of efficient centrifugal fans developed by the TsAGI (Central Aerohydrodynamic Institute). The ceramic laboratory has also worked on furnace linings.

With the introduction of high-output boilers, difficulties were experienced in obtaining steam of satisfactory quality and work was done on the design and operation of water purification equipment. In recent years, steam purifying has

Card 2/5

WV/R-78-5-24/2

25 Years of the Work of ORGRES in Power Engineering.

equipment has been developed for installation inside medium- and high-pressure boilers, whereby boiler outputs have been greatly increased.

A good deal of work has been done on brittle fracture of boiler parts and a special study was made of boiler-water conditions with the object of preventing accidents of this kind.

Turbine installations. In its early years, ORGRES worked mainly on the commissioning and acceptance tests of turbines. In recent years, tests have been made on the first examples of high-pressure turbines. A cycle of tests has recently been completed on turbo-generator type VK-100-2 of the LNZ (Leningrad Metal Works) installed at the Slavyanskaya HEPs (Slavyansk Heat and Electric Power Station) to determine the effectiveness of modifications to the flow part of the regulating stage. Other recent work concerned the conversion of small turbines for operation on reduced vacuum for purposes of heat supply. A method of chlorinating circulating water was developed to prevent organic deposits in condenser tubes. The southern division of ORGRES has done work on the starting

Card 3/5

SCV/36-36-3-34/25  
25 Years of the Work of ORGRES in Power Engineering

of boiler-turbine unit sets, by which the starting time has been greatly cut down.

District Heating. ORGRES has studied district heating since 1938. The main work was in setting up systems of centralised heat supply to towns and industries. Recently, attention has been given to external corrosion in heating systems, leading to anti-corrosion measures for pipework.

A good deal has been done on the automation of thermal processes, including the introduction of electronic equipment for automatic control of combustion and feed and also of fuel pulverisation and superheat. A method has recently been developed for regulating the output of ball mills according to the level of fuel in the drum and also on the automation of auxiliary equipment such as de-aerators, reduction- and cooling-installations and condensers.

There have been metallurgical investigations. The inspection of welded joints by ultrasonic procedures has been perfected. The Moscow Metal Laboratory has had considerable success in the development and introduction of hard electrode alloys. Recently, the apparatus and technology for melting hard alloys has been improved.

Card4/5

SCV/36-56-3-2/2

25 Years of the Work of ORGRES in Power Engineering

As operating experience accumulated, it had to be codified and distributed. In the first place, operating instructions were prepared for boiler and turbine equipment and then typical operating instructions for various conditions were prepared, also repair instructions for power equipment. ORGRES participated in the publication of safety rules and of standard norms for repair work on power equipment. Fifteen symposiums "Setting-up and Experimental Work of ORGRES" have been published.

TITLE: Device for fabricating products with an electron beam, Class 21, No.  
170593

SOURCE: Byulleten' izobreteniij i tovarnykh znakov, no. 9, 1955, 45-46

TOPIC TAGS: electron gun, electron beam, electroforming, vacuum equipment

ABSTRACT: This Author Certificate presents a device for fabricating products with an electron beam. It contains a vacuum chamber, an electron gun, a coordinate table for mounting and moving the products, and a programmed control system (see Fig. 1 on the Enclosure). To automate the fabrication process, the coordinate table is provided with drive mechanisms for rotating the table in the horizontal plane and for moving it in the vertical direction. To provide for fabrication of products of various configurations, the vacuum chamber is provided with windows on the top and side walls for mounting the electron gun in vertical or horizontal positions. To simplify the design and to eliminate lubrication inside the chamber, the drives of the table movement mechanisms are located outside the vacuum chamber. The lead screws of these mechanisms are provided with ball nuts.

"Semiautomatic Machine for Cutting Circular Flanges,"  
Engineers S. A. Gol'denberg, V. F. Khodakov

"Avtogen Delo" No 8, pp 20-22

Describes semiautomatic gas cutting machine for mass production of pipes in ship-building industry. Machine is designed to cut flanges of 50-600 mm diameter from steel 10-30 mm thick. One advantage is possibility of cutting flanges at very edge of metal sheet, bringing waste to minimum. Productivity is 85 pieces for 8 hours. Operation of four machines for 1½ years demonstrated dependability.

Title : Ignition of gaseous mixtures in a stream with an incandescent body

Periodical : Dok. AN SSSR 103/2, 277-280, Jul 11, 1955

Abstract : Investigation was conducted to determine the critical characteristics of igniting quiescent and moving gaseous media. The phenomenon of concentrated ignition boundaries (flame propagation) is explained. The role of the incandescent body when coming in contact with the gaseous medium and its functions in the boundary layer are discussed. Data are given regarding the limits of concentration, boundary velocities of the flame, flame stabilization criteria and other related phenomena. Thirteen references: 9 USSR and 4 USA (1937-1954). L.N. Khitrin, S.A. Goldenberg  
Offers a thermal theory of concentration boundaries of ignition of stationary and propagating gas mixtures which enables the determination of: (i) the boundaries of the propagation of the flame; (ii) reliable kinetic characteristics of combustion of gaseous mixtures; and (iii) critical parameters of ignition under different conditions with the aid of the characteristics of the combustible fluid alone.
